

Create prototypes that feel like the real experience
Turn your static design files into an interactive experience—no coding required.

Intuitive build: Simply connect UI elements and choose your interactions and animations.
Interactions: Define subtle interactions, like on click, while hovering, while pressing a button, and more.
Mobile-optimized: Details like device frames and momentum scrolling make your prototypes feel like the real experience.

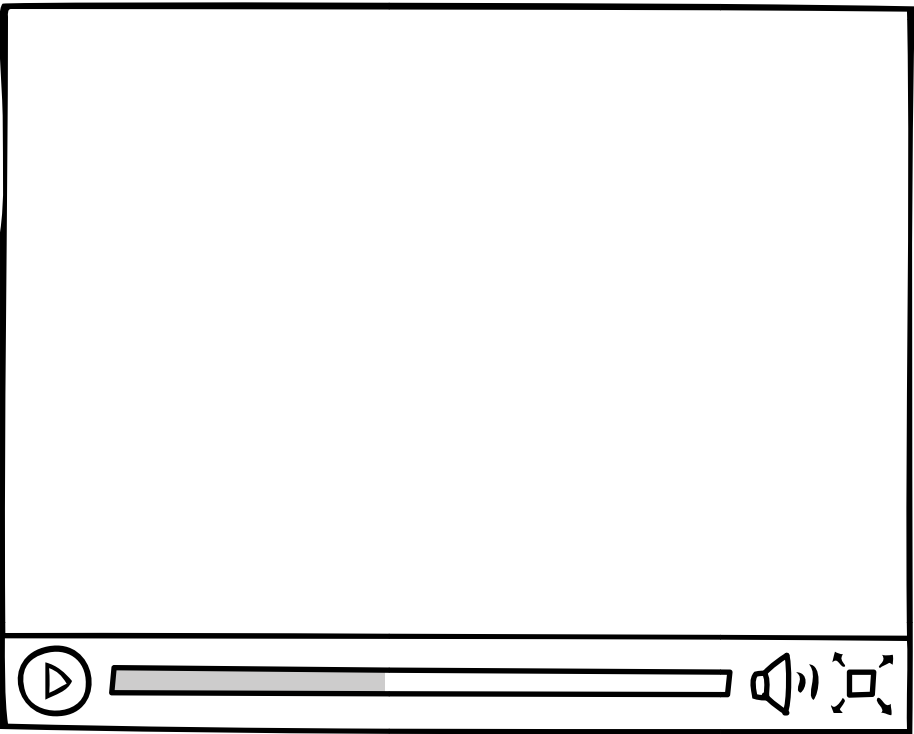

Show, don't tell your interaction vision
Take the guesswork out of development by spelling out the interaction details you envision.

Advanced transitions with Smart Animate: Automagically animate similar objects and create detailed transitions.
Dynamic overlays: Create multiple layers of interactive content overlays.
Animated GIFs: Use GIFs to represent motion designs, video elements, and subtle animations.

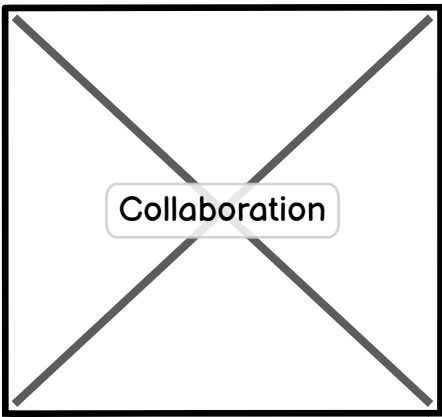

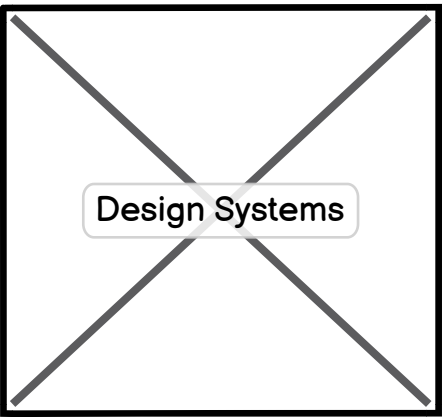

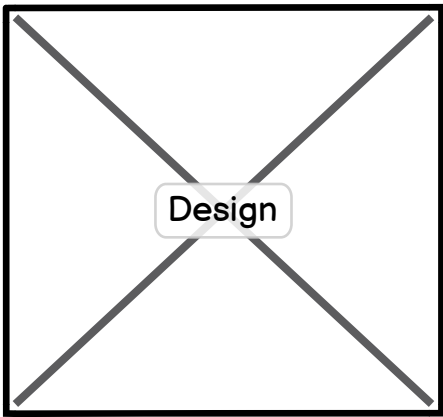

We run a really fast design process. We're constantly building, testing, and iterating. Being able to pull together a prototype in Figma so quickly and easily is massive for us.
Beth Horne, Senior User Researcher at Bulb

Do it all in one single tool
No more jumping between tools. Design, prototype, share, and collect feedback all in Figma.

All-in-one platform: Toggle between your design file and live prototype. Design edits appear instantly in your prototype.
Shareable prototype: Share a link to your prototype. View it anywhere with Internet.
Embedded commenting: Comment in a prototype. They carry over into the design file—so nothing gets lost.

Other ways to use Figma prototypes
Observe a test subject in research sessions
Interact with live prototypes in Notion or Dropbox
Create presentation slides to pitch your work
Integrate with third-party prototyping tools
